ABOUT

I am a committed agile practitioner with experience from several launches of user-centric IT solutions. With a foundation in systems development, requirements definition, and testing, I have created a broad understanding of the development process and its possible challenges. What motivates me is to act as a spider in the web in a complex environment, working with everything from coaching and problem solving to analysis. These skills have been developed in industries such as automotive, media, energy supplier, retail, IT-solution supplier, and insurance industry. My strength is the ability to identify problems and work out solutions that create optimal conditions for both global cross-functional teams, as well as in smaller groups. I achieve this by continuously bridging the gap between IT and business. This is done by communicating openly and bringing a strong sense of responsibility to the table.
